

Pandemic Infections

Beware of widespread infections

by Peter Lim

Since last year, there has been a widespread attack of infectious diseases affecting many people here and on a worldwide scale. In our NeB research into energy therapy, we discovered many are simultaneously attacked by mycoplasma, multiple sclerosis, microorganisms (the 3Ms), bird flu, dengue and H₁N₁ linked to advanced flu. SARS could also be coming to our shore.

Potential Total Organ Dysfunctions

The attacks come in three in one, namely mycoplasma, multiple sclerosis, microorganisms, or four in one with bird flu, or some five in one with dengue fever. Besides, some have attacks from parasites, allergies, toxins and joint pain. All combined, they are more serious and deadly compared to common flu or colds, which could lead to a potential collapse of key organs with possible tumour formations in a short period of time. With these, cancer rate could climax to one in every two persons.

Mycoplasma bacteria usually come together with fungi and bacteria to cause disorders of the digestive/pancreas/liver/circulatory systems with sleep and mental focus disorders, attacking throat, heart, lungs, brain and many organs. It causes fever, cough, bronchitis, sore throat, headache and tiredness. Multiple sclerosis attacks the organ nerves, eyes and spinal cord with potential paralysis and organ collapse, with much pain, discomfort and stress. Microorganisms come with

microscopic bacteria, fungi, viruses, algae and protozoa to enhance the crises. Bird or avian flu is common in our research studies, aggravating present and past sicknesses that had already been healed. Dengue fever is so common these days with some having fever, headache, muscle and joint pains, rashes, creating disorders of bones and blood cells with internal bleeding or platelet drop, tiredness and mental focus disorder.

Attack on Weak Immune Systems

These cases are prevailing in many who are carriers to adversely and repeatedly affect those who are weak. Most would not die of cancer but of infections. Cancer could come in a matter of days! We have a young client who was suffering from leukaemia whose bone marrows had been compromised by drug therapy, and unable to produce blood cells. Her pathogenic attacks included bird flu and dengue fever, each time she went for blood transfusion. We wondered whether these pathogens were also present in the blood donated. Within a day of her transfusion, the aggressive fluid build-up in the lungs choked her to death, possibly from bird flu.

Attack on Premature Babies

Many came to seek our help. Amongst them was a lady who got all the above

attacks, and overnight, she was totally disoriented with sleep and mental focus disorders and total organ collapse. We dealt with the roots and in a short period of time she was restored. Another client on dialysis had the pathogenic attacks with kidney and liver cancer. After removing the pathogens, tumour activities were also gone. Many children were reported to be born prematurely last year. We tested one case and found both mother and the seven-month foetus were attacked by multiple sclerosis and bird flu, and the child was born prematurely weighing only 1.25kg, with high degree of jaundice and digestive dysfunction.

NeB Meets Dynamic Complex Challenges

NeB research is poised to deal with such pathogenic crises, for anyone and in any part of the world. We do tests that are non-invasive to determine the causes and answers and identify the presence of tumours. NeB is a state-of-art technology, timely to meet complex challenges just like the non-wire system through mobile phones!
