

Understanding Multiple Sclerosis

by Peter Lim

A link between multiple sclerosis and dengue?

Multiple Sclerosis or MS is an autoimmune disease virus that attacks the central nervous system affecting the brain, spinal cord and optic nerves, and could potentially attack all key organs. It attacks organ nerves, bones, muscles, tissues, membranes, lymph nodes and ligaments, and in serious cases, could lead to potential organ paralysis with excruciating pain. The attacks could result in blindness, numbness, and tingling limb sensation, mental focus disorders, memory loss, with limb joints and spine in great pain, “paralysing the limbs and organs”, creating imbalance and may force one to walk with a walking stick or be confined to a wheel chair.

Presence of MS in Dengue Cases

For years in our NeB Research, we did not even have one case of MS. Then since April 2012 and to date, we have hundreds of cases of clients being attacked by dengue and MS. MS is not transmitted from human to human. Then how is this virus transmitted? We stumbled on the link between dengue and MS. We picked 100 cases for our studies involving clients from several countries. For every dengue case, we also discovered the presence of MS with no exceptions, or 100% linked to aedes mosquitoes. While dengue attacks bones and marrows and causes internal bleeding and platelet count drop, MS attacks the central nervous system and could also attack all organs with potential paralysis. The accounts of some in our NeB research studies are interesting, to alert the dangers that lie ahead if the aedes mosquitoes are not firmly dealt with, to deal with the threats of deadly diseases, and especially in critical moments like surgery.

Accounts from Our NeB Studies

Months back, I alerted a friend who had a heart attack. From my NeB photo analysis, I warned the family that he had MS and dengue bleeding which must be dealt with as otherwise there could be potential danger in surgery. He went ahead and the first heart stent was done successfully. While doing the second heart stent, the kidneys failed (as I presumed the MS had paralysed the kidneys). Dialysis was substituted but failed too, and he died in the operating theatre. He had dengue bleeding.

Another was having severe spine pain affecting his balance in walking. He had to use a walking stick. He has MS and was not dealt with when he went for his spine operation. The root cause has not been solved although operated, and this continues to affect the mobility of his body from head to limbs. We would not be surprised that many could be experiencing the same after the operations.

A man had severe attacks on the joints, knees, hands and anchors and had excruciating pain. He went from clinic to hospital, to natural therapies including acupunctures. His pain still persisted without end until he was referred to try our NeB. We traced his pain to the numerous root causes, including dengue and MS and used our patches and “broadcasting” the energy healing frequencies by remote to speed up the healing. Within the first

month, he experienced much relief, and by the second month, he was completely well and so pleased with our support.

A Personal Experience

Recently I had a severe MS attack on the elbow and thigh joints and knees. It was as if the whole arms were taken out from the sockets. I dragged my feet with a limp. I was in excruciating pain when putting on my socks. It was good experience for me to isolate and deal with the pain, right to the targets using NeB energy therapy. This experience has taught me how to deal with MS very decisively and systematically. This is especially so when MS could attack and paralyse the organs that are weak, especially to further weaken the organs, and if attacked by tumours, to bring potential collapse to the whole body system.

World's First Discovery

This discovery of linking MS to aedes mosquitoes and dengue is a world first to help other researchers to explore its full potentials to benefit mankind. Nature's Glory is very happy to discover the link and provide timely answers to benefit the world. If you have such challenges, send your photo to us with a small research fee, for a non-invasive test and report on your challenges. This is one good way to achieve a long-term solution. Visit us at www.natures-glory.com, click to nano energy boosters for various answers to your challenges.
