

The Lamp of the Body is the **EYE** By Mr. Peter Lim

With technological advancements using energy, eye problems such as cataracts, glaucoma, macular degeneration, floaters, conjunctivitis, and long-sightedness could be challenges of the past. Many eyes would be brightened up soon without surgery and its side effects. This is great news for the world!

EYE DISEASES

Many viruses, bacteria, parasites and fungi can invade the human body but they are also capable of attacking the surface and the interior of the eyes. Eye diseases such as cataracts, glaucoma, macular degeneration, floaters, and conjunctivitis could result.

Cataract is a clouding of the eye lens that affects vision. It can occur in either or both eyes but not spreading from eye to eye. It is often related to ageing, past eye injury, radiation, use of steroids or even babies at birth or through their childhood. Cataract happens when the crystallins or protein of the eye loses its function as the eye ages. It can also be traced to diabetes or birth caused by infections during pregnancy. Cataract symptoms include visions that are cloudy or foggy, blurry or distorted, changes in colour vision, poor night and double vision, with a white or "milky" spot over the eye pupil.

Glaucoma is the second leading cause of blindness afflicting about 67 million people. The eyeball is filled with a watery substance called aqueous humour which creates pressure in the eye to give its shape. In healthy eyes, the fluid constantly flows in and out of the eye to nourish it. It drains back into the bloodstream at the same rate that it is produced in order to maintain the correct pressure. Glaucoma occurs when the drainage tubes within the eye become slightly blocked, preventing the aqueous humour from draining properly. When the fluid cannot be drained properly, the pressure of the eye builds up and causes damage to the optic nerves. Its symptoms include slow vision loss, gradual peripheral vision loss and tunnel vision in advanced stage, with redness, severe pain and swelling, leading to nausea, vomiting and seeing rings of light.

Floaters are dark dots, lines or particles floating in the eye. Floaters are experienced by people in their teens and 20s, or with short-sightedness, becoming more frequent as one ages. It can

be caused by stress, parasites, bleeding from abnormal growth of blood vessels and scarring, with majority due to degenerative changes in the vitreous, a clear jelly-like fluid of the eye.

Macular Degeneration (AMD or ARMD) affects the central vision due to the degeneration of the retina, making reading or driving impossible in severe cases. It does not cause total blindness as it does not affect the peripheral vision. It is usually caused by genetics, ageing, nutrition deficiency, smoking, sunlight exposure, high blood pressure and drug side effects. The tissue of the macula stops working effectively because the tiny blood vessels fail to nourish it properly. Fluids from newly formed blood vessels leak into the retinal tissue and cause vision loss. Vision of straight lines looks wavy, shapes blurry, colours dimmed and foggy.

Conjunctivitis (Red Eye) is an infection of the transparent membrane (conjunctiva) that lines the eyeball that causes the eye to swell and makes small blood vessels in the eye to become red. It is often due to bacteria, viruses, allergies or chemical irritants. It causes redness in the eye or eyes, itchiness, with sticky discharge and could spread to others.

Long-sightedness (Hyperopia) is a sight problem that affects your ability to see close-up objects, requiring reading glasses related to ageing. It can be present from birth when the eye ball is short or the lens too weak compared to the normal eye. Those affected suffer from eye strain, headaches, irritability and nervousness after prolonged concentration. In some children, squint can develop and if not treated, it can lead to permanent vision problems.

Conventional treatments include surgery and steroids. But there are risks involved including infection, inflammation, bleeding, loss of vision, retinal detachment, drooping eyelids, and causes of secondary cataracts and glaucoma.

LATEST ADVANCEMENT IN CELLULAR ENERGY TECHNOLOGY

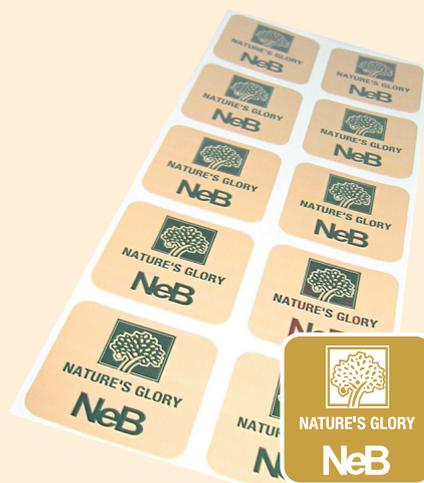

We believe that over 90 per cent of diseases including eye challenges are due to bacteria, viruses, fungi, parasites, toxins, and tumours. Each of these has energy levels. By introducing energy levels higher than them, we have discovered that the increased cellular energy

is able to energise the immune system to respond to these challenges.

With 20 years of research, NeB technology in nano, homeo, aura, quantum physics and stem cells incorporates the missing energy levels into an Eye Support patch (P11) which is designed to restore the energy of the eyes to include challenges like cataracts, glaucoma, floaters, and macular degeneration. Our Colds and Flu Support (P5 & 13) helps in conjunctivitis depending on whether it is cold or viral related. P11A or New View helps for long-sightedness so that you may dispense with reading glasses in about three months. S11 or Eye Stem helps repair the eyes to a healthy state with no side effects as we are only dealing with energies. It is placed on the skin for a three-day change.

My mother is 89 years old with serious cataracts in both eyes, with surgery done on one eye but turned bad. She was almost in total darkness and fearful of walking. Within six months of using P11, she was able to see again without any surgery. We did not want her to go for surgery again as she developed very high blood pressure during surgery.

We believe the NeB technology is going to restore many eyes to a healthy state. It also meets many health challenges related to pathogens, toxins and tumours. It works well for those who believe and act upon it, with very positive and encouraging results!
