

Fight Dengue and Win

Putting an end to dengue attack *by Peter Lim*

Many of our clients were found to have dengue months before the announcement of dengue spread in the newspapers. The discovery is part of our continuing NeB research studies into pathogens covering bacteria, viruses, fungi, parasites, allergies, toxins and tumours. Our clients were alerted but surprised, as many did not have the usual fever or rash!

Dengue cases have risen to 11,000 this year, with two deaths at the time of writing. Some experience the onset of haemorrhage fever, headache, muscular and joint aches, nausea and vomiting. But from our NeB studies, dengue virus attacks various organs including brain, bones, spleen, knees, lungs, kidneys, liver, lymphs, nose, eyes, mouth, pancreas, pituitary and pineal glands, spine, intestines, skull, sex organs, stomach, mucous membranes, nerves, muscles, and ligaments. In most cases, it causes internal bleeding with platelet drop affecting bone marrows. And if critical, it may lead to death!

A Patch against Dengue

Our NeB patch 37 when applied to the skin will send the energy signatures against dengue targets in the body, to potentially put an end to the dengue attack within three

or at most, seven days. It helps stop platelet decline and bone and blood disorders. We have 100% success! Besides the patch, we use a machine to broadcast the healing frequencies to the individuals without their need to see us or be attached to a machine! This NeB technology is so advanced, covering nano, aura, quantum physics, homeopathy and stem cell energy technologies, with no side effects to the young and old, and even safe for unborn babies!

We hope to have NeB breakthrough to control mosquito spread in landed properties, to prevent/minimise external mosquitoes from entering, breeding and biting. One very interesting product that may potentially deter mosquitoes from breeding is called Adam's ClayMin or Adam's ClayPack. Years back, I did an extensive research to see whether mosquitoes could breed in stale water with our clay powder. If sufficient powder is used, I observed no mosquitoes could breed. Also, larvae could not grow into maturity and eventually die. This test is not conclusive but potential to prevent mosquitoes from breeding in pots, ponds, drains, etc.

Other Factors to Help Fight Dengue

Health Supplements

Apart from NeB, we have supplements to restore platelet count quickly to healthy levels. Chlorella Growth Factor or CGF comes

from chlorella green algae extract, containing nucleic substances good for cells, to build up platelet counts to healthy levels. A bottle of CGF may help to restore platelet count in three to seven days! Chlorella tablets contain 20% CGF. Other supplements to boost the immune system. These include propolis-balls-plum balls, iodine in seaweeds, aloe vera juice, flax oil and Vitality C. Bio-Good, a mushroom drink, is also good and helps to regulate hypertension, allergies and diabetes.

Air Purifier and Juicer

Serumi Air Filter with negative cluster ions like fountain fall helps to eliminate and inhibit airborne allergens, bacteria, viruses, germs and fungi, and potentially minimises mosquito attacks for sound sleep. It is also good for allergies, asthma, sinuses and skin diseases. Radired Water System produces alkaline ionic water to remove blood acidity, good for dehydration especially during dengue attacks. Blendtec Blender blends and juices food and smoothies for food and drinks to be easily digestible to promote appetite.

Soaps and Essential Oils

To help deter mosquito bites, use Eucalyptus in Dr. Bronner's Organic Soap. Essential oils like purification, lemon grass, lavender and thieves are useful. MiEnviron, an organic spray with essential oils, also helps. All the above helps to fight dengue and win!
